# Abstract

Due to its fast slewing rates, the Warkworth 12m radio telescope can be on source in a short period after a gamma-ray burst (GRB) alert and conduct follow-up radio observations of GRB and other transient events.

We report on the work that is currently being undertaken to integrate the Field System with the GRB Coordination Network (GCN) alert system.

The aim is to undertake both single-dish (Warkworth) and interferometric (with Australian antennas) observations of these events.

In conjunction with this project work is taking place to utilize real-time autocorrelating spectrometer with the aim to handle dedispersion when observing pulsars and searching for transient events.

Western Australia

# GCN: The Gamma-ray Coordinates Network

Locations of GRBs and other Transients (the Notices) detected by spacecraft (most in real-time while the burst is still bursting and others that are delayed due to telemetry down-link delays).

An alerts is transmitted to the receiving sites via several methods, such as E-mail, Phone/Modem, Pager and Internet Sockets.

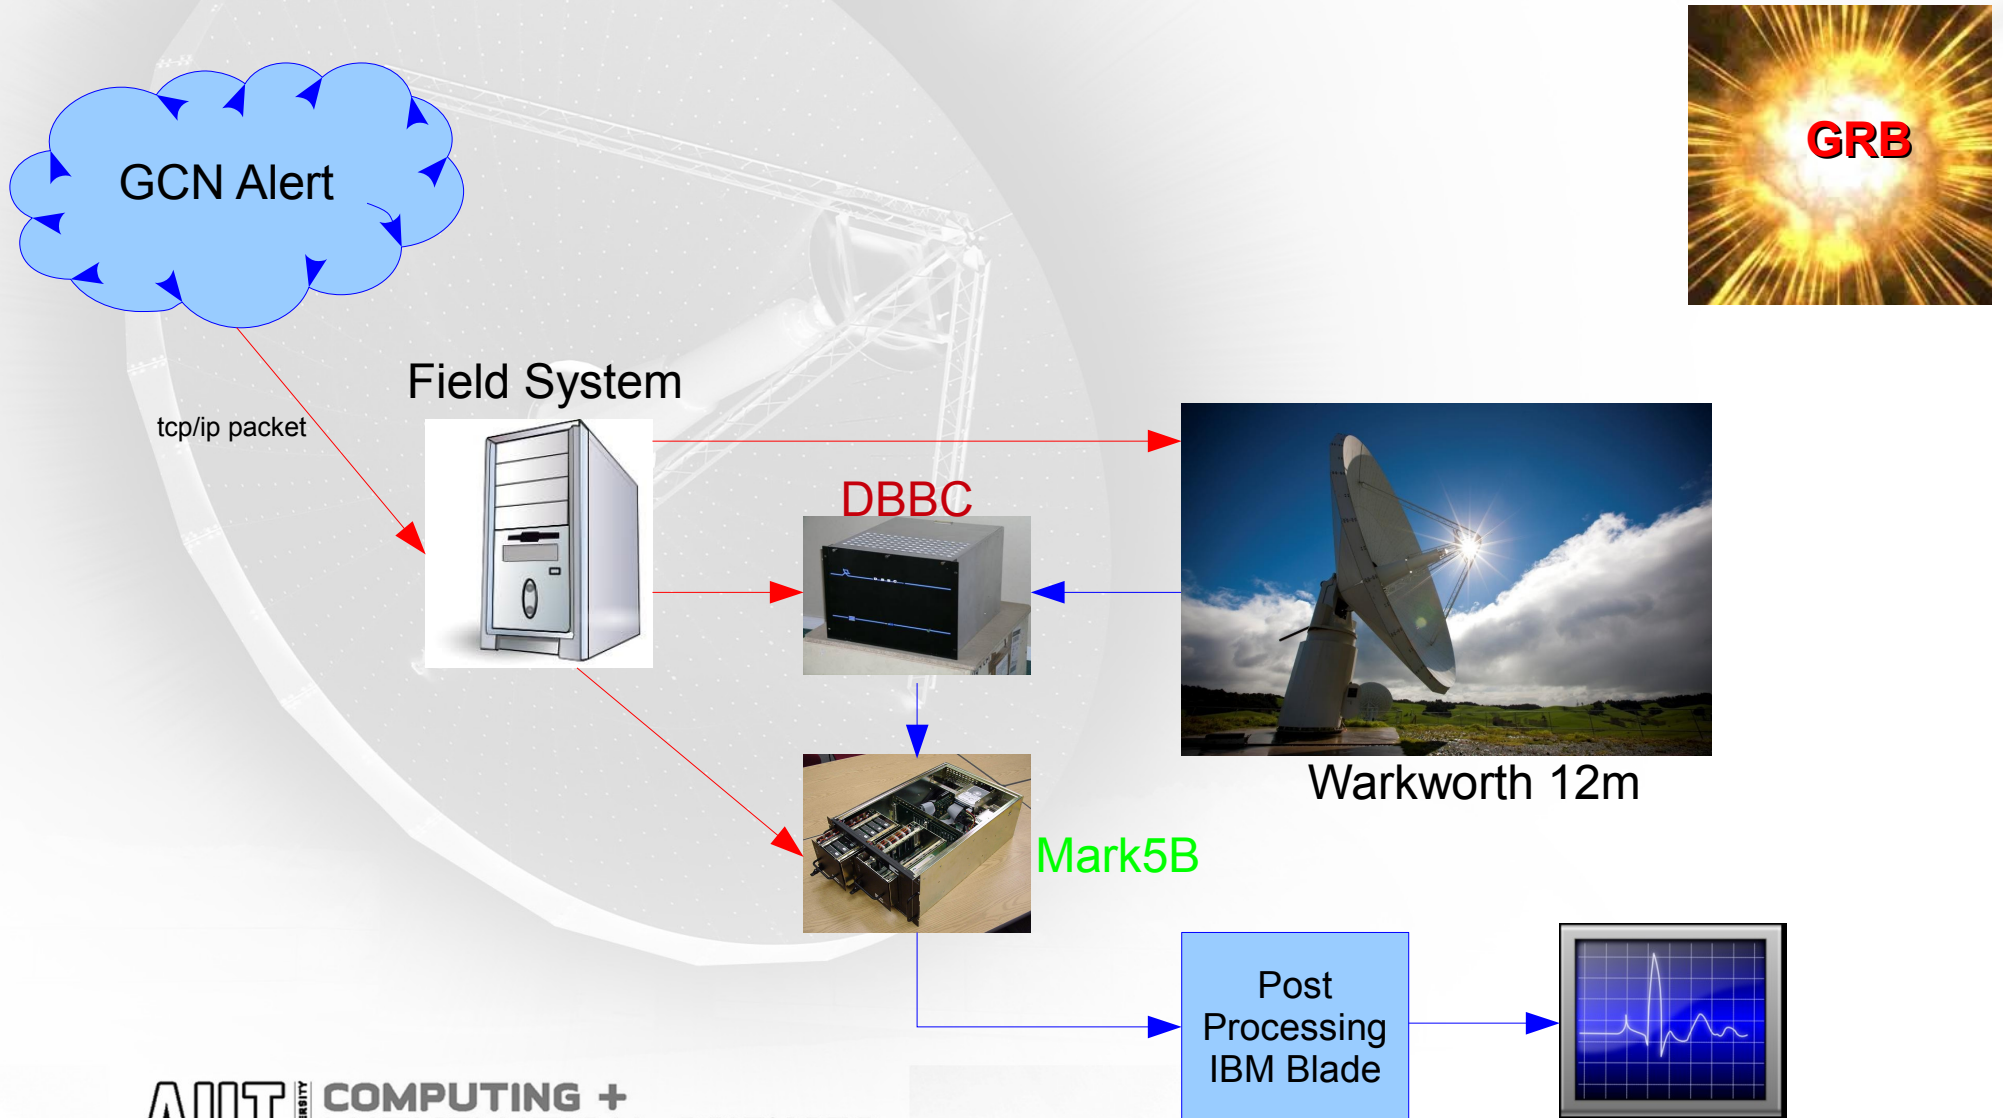

<http://gcn.gsfc.nasa.gov/>

# Example of alert received through GCN socket\_demo

```

I have put socket\_demo under `"/usr2/st/gcn"` on the Field System. As this will be a local station procedure. It has been modified to also communicate with the DBBC and Mark5B.

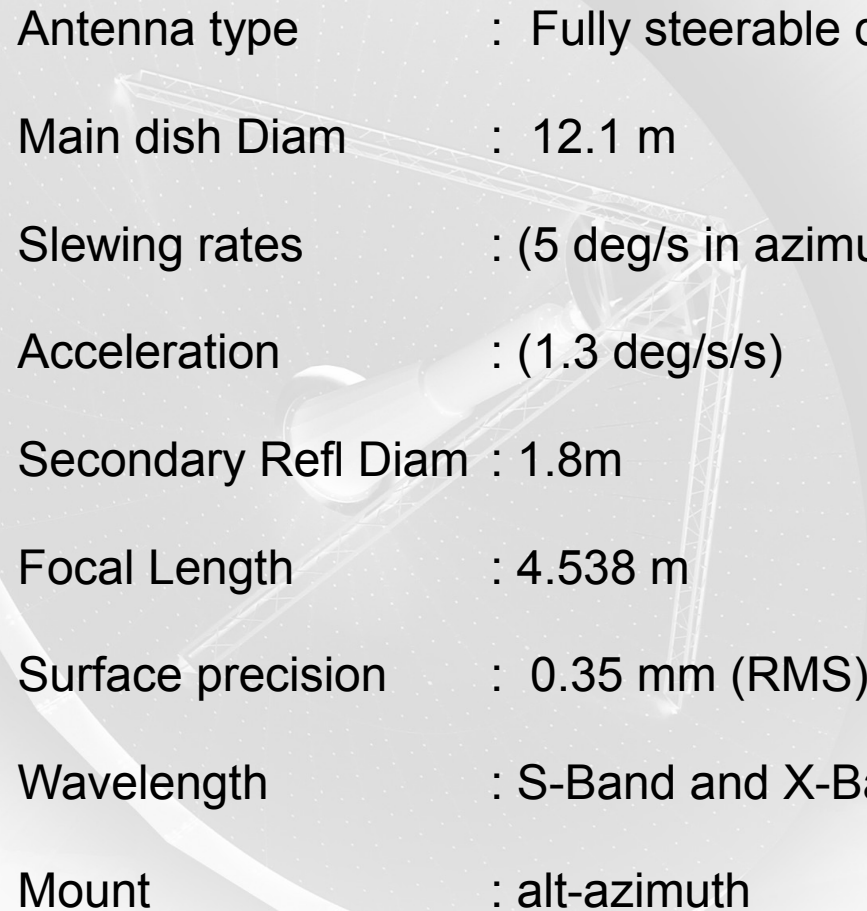

# Current System Configuration

Warkworth 12m

# AUT 12m Antenna

Antenna type	: Fully steerable dual shaped Cassegrain
Main dish Diam	: 12.1 m
Slewing rates	: (5 deg/s in azimuth and 1.25 deg/s in elevation)
Acceleration	: (1.3 deg/s/s)
Secondary Refl Diam	: 1.8m
Focal Length	: 4.538 m
Surface precision	: 0.35 mm (RMS)
Wavelength	: S-Band and X-Band
Mount	: alt-azimuth

1min 18 secs to be on source and tracking

GPU's the next step in compute power!

# Future System Configuration

# Real-time autocorrelating spectrometer

Stream-based approach using hardware accelerators for radio astronomy applications,  
Mahmoud Mahmoud, AUT

Future work is to link this with the Field System

Also to accept real-time streaming of data either from the DBBC or Mk5C

We are also working with Richard Dodson and another GPU Autocorrelator  
(<http://sourceforge.net/projects/g-auto/>)

This has been tested real-time over the network from Warkworth (via KAREN) to Perth (via AARNET).

Future work is to link this with the Field System

Comparison between a multi-core CPU (IBM blade) server and one GPU.

IBM Blade -m5spec 16MHz Band with 32767 channels, 12 mins

GPU – autocorrelator same data file but with 524290 channels, 9.8 secs

# Conclusions

- Good things can be done with a small dish
- We can be on source within 2 minutes
- GPU's provide a significant leap forward for real-time processing
